

ABSTRACT OF THE DISCLOSURE

A position detecting method including steps of sensing an image of first and second marks, orthogonally transforming a signal obtained in the sensing step, and calculating each position of the first and second marks based on a phase of a corresponding frequency component obtained in the transform step. Patterns are disposed at a first interval in the first mark, patterns are disposed at a second interval in the second mark, and one of the first and second intervals is not an integer multiple of the other of the first and second intervals.
